- Thanks: Prof. Mario Gerla, UCLA, for providing most of the material

---

---

---

---

---

---

---

---

## Ad-Hoc Networks

- Built by the users themselves to support specific (in time, space, applications) needs
  - Example: using 802.11 BSS as you did in the lab
- Are generally closed, but "gateways" are coming into play to connect them to the rest of the world
- The key point is the requirement to build and support dynamically the topology "on-the-fly"
  - No network planning
  - No hierarchy
  - No engineering

---

---

---

---

---

---

---

---

## Sensor/Actuators Networks

- Ad-Hoc networks whose goal is specifically making some kind of measure (sensing) and, in case, react to some change/event (actuating)
- Normally battery powered: one more problem on energy consumption
- Are the backbone of "Ambient Intelligence" concepts

---

---

---

---

---

---

---

---

## Personal Networks

- PAN "personal area network"
- IEEE 802.15 sub-project
- Very short range (1-5m) and extremely low power (< 10mw EIRP)
- The goal is connection of devices for "cable replacement"
  - Earphone with cell/HiFi/TV
  - PDA, cell phone, clock, alarm, laptop
  - mouse, keyboard, laptop
  - ...

---

---

---

---

---

---

---

---

## Technologies

- 802.11
  - Do you know it ☺
- Bluetooth (802.15.1)
  - Master/Slave architecture
  - Optimized for low bandwidth, real time communications
- ZigBee (802.15.4)
  - Meshed architecture
  - Low power consumption
- All use the same ISM bands

---

---

---

---

---

---

---

---

## Open (Not Yet Standard) Issues

- Routing
  - How to find the best route across a "temporary" network?
  - Coordination of multi-hop transfer
  - Stability of routes
- Topology Management
  - Cooperation among nodes
  - How to reward nodes that use resources for others
- Usage context
  - Ad Hoc Networks were born for military applications
  - Their civilian use is appealing, but do we really need them?

Renato.LoCigno@dit.univr.it

AdHoc - PAN - Sensors 7

---

---

---

---

---

---

---

---

## Bluetooth

---

---

---

---

---

---

---

---

## Bluetooth Specifications

- A hardware/software/protocol description
- An application framework

Renato.LoCigno@dit.univr.it

AdHoc - PAN - Sensors 9

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

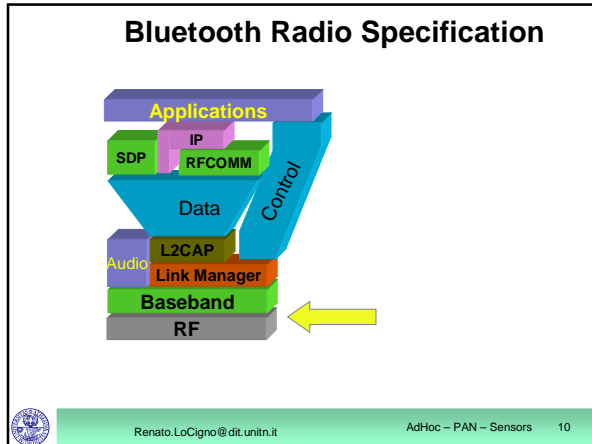

---

---

---

---

---

---

---

---

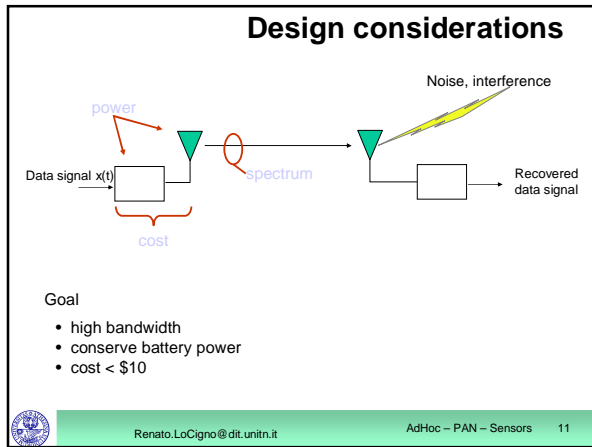

---

---

---

---

---

---

---

---

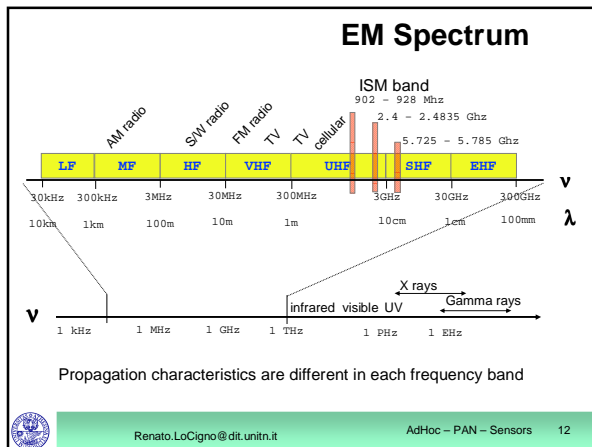

---

---

---

---

---

## Bluetooth Physical link

### • Point to point link

- master - slave relationship
- radios can function as masters or slaves

### • Piconet

- Master can connect to 7 slaves
- Each piconet has max capacity = 1 Mbps
- hopping pattern is determined by the master

Renato.LoCigno@dit.unitn.it

AdHoc - PAN - Sensors 16

---

---

---

---

---

---

---

---

## Connection Setup

### • Inquiry - scan protocol

- to learn about the clock offset and device address of other nodes in proximity

Renato.LoCigno@dit.unitn.it

AdHoc - PAN - Sensors 17

---

---

---

---

---

---

---

---

## Inquiry on time axis

Renato.LoCigno@dit.unitn.it

AdHoc - PAN - Sensors 18

---

---

---

---

---

---

---

---

### Piconet formation

- Page - scan protocol
  - to establish links with nodes in proximity

- Master
- Active Slave
- Parked Slave
- Standby

Renato.LoCigno@dit.univr.it
AdHoc - PAN - Sensors 19

---

---

---

---

---

---

---

---

### Addressing

- Bluetooth device address (BD\_ADDR)
  - 48 bit IEEE MAC address
- Active Member address (AM\_ADDR)
  - 3 bits active slave address
  - all zero broadcast address
- Parked Member address (PM\_ADDR)
  - 8 bit parked slave address

Renato.LoCigno@dit.univr.it
AdHoc - PAN - Sensors 20

---

---

---

---

---

---

---

---

### Piconet channel

Renato.LoCigno@dit.univr.it
AdHoc - PAN - Sensors 21

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

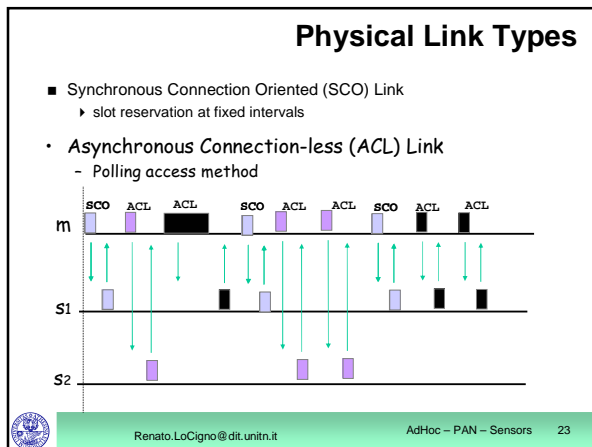

---

---

---

---

---

---

---

---

---

### Packet Format

72 bits

54 bits

Header

0 - 2744 bits

Payload

Voice

No CRC  
No retries  
FEC (optional)

Data

ARQ  
FEC (optional)

Renato.LoCigno@dit.unitn.it
AdHoc - PAN - Sensors 25

---

---

---

---

---

---

---

---

---

---

---

---

### Access Code

72 bits

**Purpose**

- Synchronization
- DC offset compensation
- Identification
- Signaling

**Types**

- Channel Access Code (CAC)
- Device Access Code (DAC)
- Inquiry Access Code (IAC)

Renato.LoCigno@dit.unitn.it
AdHoc - PAN - Sensors 26

---

---

---

---

---

---

---

---

---

---

---

---

### Packet Header

54 bits

**Purpose**

- Addressing (3) → Max 7 active slaves
- Packet type (4) → 16 packet types (some unused)
- Flow control (1) → Broadcast packets are not ACKed
- 1-bit ARQ (1) → For filtering retransmitted packets
- Sequencing (1)
- HEC (8) → Verify header integrity

total	18 bits
-------	---------

Encode with 1/3 FEC to get 54 bits

Renato.LoCigno@dit.unitn.it
AdHoc - PAN - Sensors 27

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

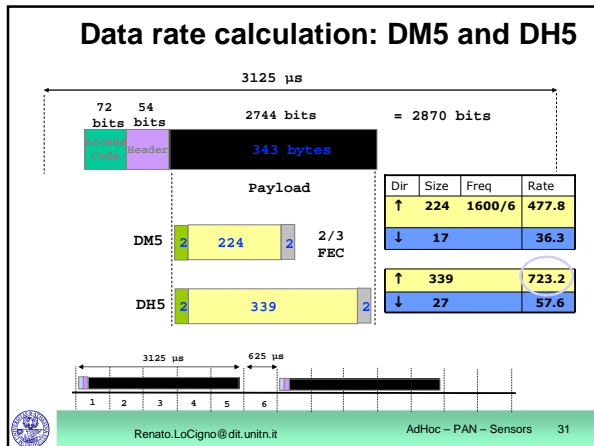

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Scatternet

Renato.LoCigno@dit.unitn.it      AdHoc – PAN – Sensors      34

---

---

---

---

---

---

---

---

### Scatternet, scenario 2

How to schedule presence in two piconets?  
Forwarding delay ?  
Missed traffic?

Renato.LoCigno@dit.unitn.it      AdHoc – PAN – Sensors      35

---

---

---

---

---

---

---

---

### Baseband: Summary

- TDD, frequency hopping physical layer
- Device inquiry and paging
- Two types of links SCO and ACL links
- Multiple packet types (multiple data rates with and without FEC)

Renato.LoCigno@dit.unitn.it      AdHoc – PAN – Sensors      36

---

---

---

---

---

---

---

---

---

---

---

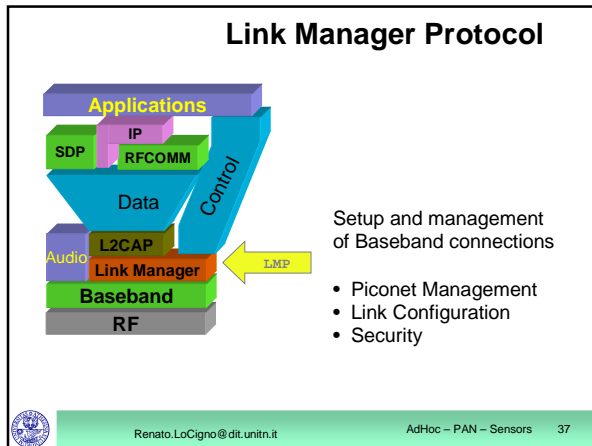

---

---

---

---

---

---

---

---

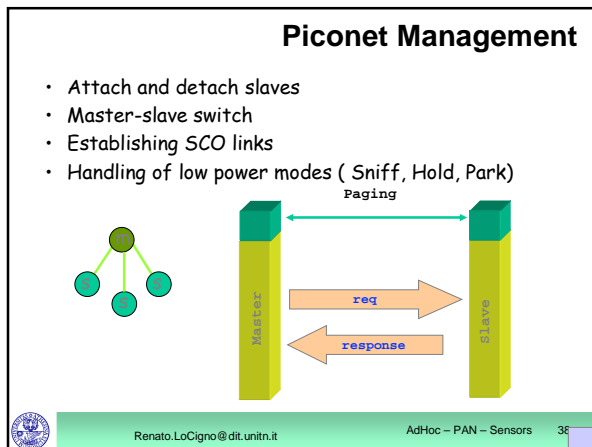

---

---

---

---

---

---

---

---

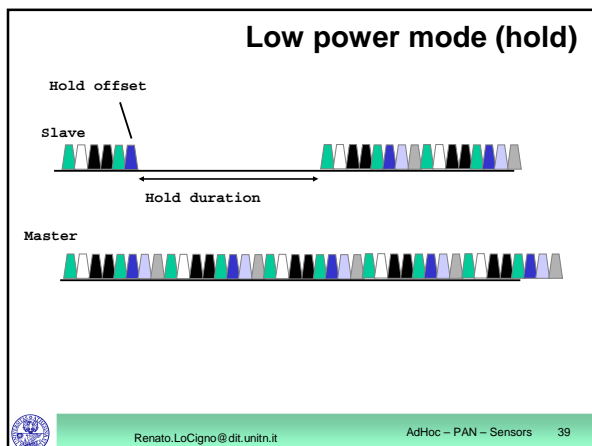

---

---

---

---

---

### Low power mode (Sniff)

• Traffic reduced to periodic sniff slots

Renato.LoCigno@dit.univr.it      AdHoc – PAN – Sensors      40

---

---

---

---

---

---

---

---

---

---

### Low power mode (Park)

• Power saving + keep more than 7 slaves in a piconet

• Give up active member address, yet maintain synchronization

• Communication via broadcast LMP messages

Renato.LoCigno@dit.univr.it      AdHoc – PAN – Sensors      41

---

---

---

---

---

---

---

---

---

---

### Connection establishment & Security

• Goals

- Authenticated access
  - Only accept connections from trusted devices
- Privacy of communication
  - prevent eavesdropping

■ Constraints

- ▶ Processing and memory limitations
  - \$10 headsets, joysticks
- ▶ Cannot rely on PKI
- ▶ Simple user experience

Renato.LoCigno@dit.univr.it      AdHoc – PAN – Sensors      42

---

---

---

---

---

---

---

---

---

---

## Authentication

- Authentication is based on link key (128 bit shared secret between two devices)
- How can link keys be distributed securely ?

---

---

---

---

---

---

---

---

---

---

## Pairing (key distribution)

- Pairing is a process of establishing a trusted secret channel between two devices (construction of initialization key  $K_{init}$ )
- $K_{init}$  is then used to distribute unit keys or combination keys

---

---

---

---

---

---

---

---

---

---

## Link Manager Protocol Summary

- Piconet management
- Link configuration
  - Low power modes
  - QoS
  - Packet type selection
- Security: authentication and encryption

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

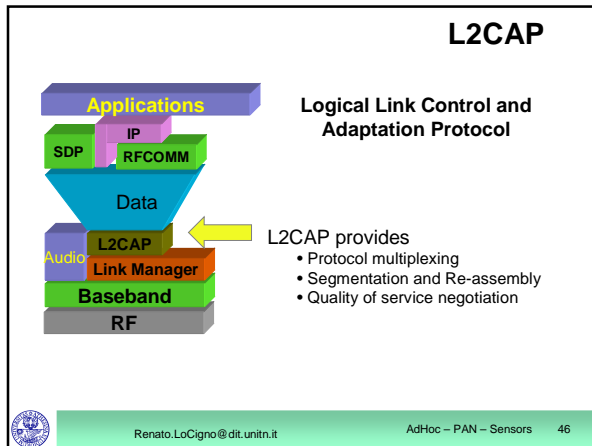

---

---

---

---

---

---

---

---

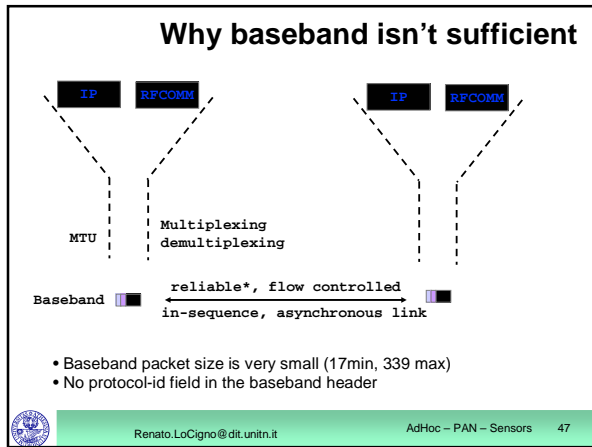

---

---

---

---

---

---

---

---

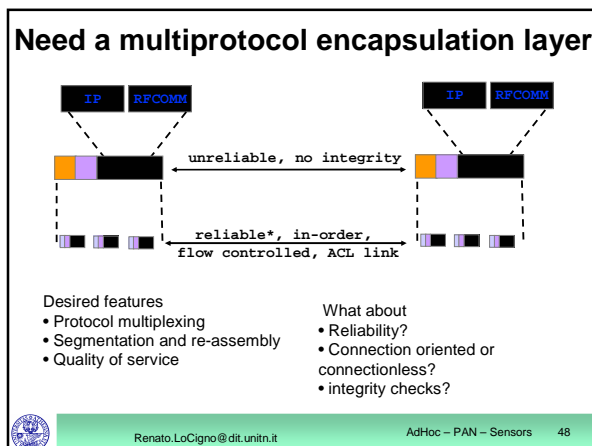

---

---

---

**Segmentation and reassembly**

min MTU = 48  
672 default

Baseband packets

- cannot cope with re-ordering or loss
- mixing of multiple L2CAP fragments not allowed
- If the start of L2CAP packet is not acked, the rest should be discarded

Renato.LoCigno@dit.unitn.it AdHoc – PAN – Sensors 49

---

---

---

---

---

---

---

---

---

---

**Bluetooth Service Discovery Protocol**

Renato.LoCigno@dit.unitn.it AdHoc – PAN – Sensors 50

---

---

---

---

---

---

---

---

---

---

**Example usage of SDP**

- Establish L2CAP connection to remote device
- Query for services
  - search for specific class of service, or
  - browse for services
- Retrieve attributes that detail how to connect to the service
- Establish a separate (non-SDP) connection to use the service

Renato.LoCigno@dit.unitn.it AdHoc – PAN – Sensors 51

---

---

---

---

---

---

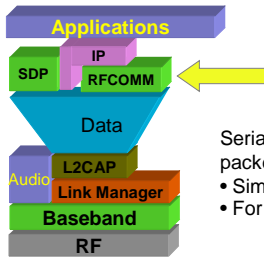

---

---

---

---

## Serial Port Emulation using RFCOMM

Serial Port emulation on top of a packet oriented link

- Similar to HDLC
- For supporting legacy apps

---

---

---

---

---

---

---

---

## Serial line emulation over packet based MAC

### • Design considerations

- framing: assemble bit stream into bytes and, subsequently, into packets
- transport: in-sequence, reliable delivery of serial stream
- control signals: RTS, CTS, DTR

---

---

---

---

---

---

---

---

## IP over Bluetooth V 1.0

### GOALS

- Internet access using cell phones
- Connect PDA devices & laptop computers to the Internet via LAN access points

---

---

---

---

---

---

---

---

# Bluetooth Current Market Outlook

---

---

---

---

---

---

---

---

## Market Forecasts for year 2005

---

---

---

---

---

---

---

---

## Biggest challenges facing Bluetooth

- Interoperability
  - Always a challenge for any new technology
- Hyped up expectations
- Out of the box ease of use
- Cost target \$5
  - well below that
- Critical mass
  - one billion devices sold by Nov.2006
- RF in silicon
- Conflicting interests - business and engineering

---

---

---

---

---

---

---

---

### Value to carriers: Synchronization and Push

- More bits over the air
- Utilization of unused capacity during non-busy periods
- Higher barrier for switching service providers

---

---

---

---

---

---

---

---

### Value to carriers: Cell phone as an IP gateway

Will Pilot and cell phone eventually merge?

- More bits over the air
- Enhanced user experience
  - Palmpilot has a better UI than a cell phone
- Growth into other vertical markets

---

---

---

---

---

---

---

---

### Value to carriers: Call handoff

Threat or opportunity?

- More attractive calling plans
- Alleviate system load during peak periods
- Serve more users with fewer resources

---

---

---

---

---

---

---

---

# ZigBee and 802.15.4 for Personal Area and Sensor Networks

---

---

---

---

---

---

---

---

**Outline**

- ZigBee and 802.15.4 solution
- ZigBee vs Bluetooth
- Applications
- Conclusions

 Renato.LoCigno@dit.univr.it AdHoc – PAN – Sensors 62

---

---

---

---

---

---

---

---

## The ZigBee Alliance Solution

- Targeted at home and building automation and controls, consumer electronics, PC peripherals, medical monitoring, and toys
- Industry standard through application profiles running over IEEE 802.15.4 radios
- Primary drivers are **simplicity, long battery life, networking capabilities, reliability, and cost**
- Alliance provides interoperability and certification testing

 Renato.LoCigno@dit.univr.it AdHoc – PAN – Sensors 63

---

---

---

---

---

---

---

---

## The Wireless Market

Renato.LoCigno@dit.univr.it

AdHoc - PAN - Sensors 64

---

---

---

---

---

---

---

---

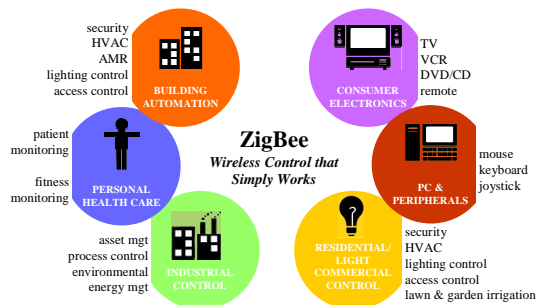

---

---

---

---

## Applications

Renato.LoCigno@dit.univr.it

AdHoc - PAN - Sensors 65

---

---

---

---

---

---

---

---

---

---

---

---

## Development of the Standard

- **ZigBee Alliance**
  - 50+ companies: semiconductor mfrs, IP providers, OEMs, etc.
  - Defining upper layers of protocol stack: from network to application, including application profiles
  - First profiles published mid 2003
- **IEEE 802.15.4 Working Group**
  - Defining lower layers of protocol stack: MAC and PHY released May 2003

Renato.LoCigno@dit.univr.it

AdHoc - PAN - Sensors 66

---

---

---

---

---

---

---

---

---

---

---

---

## IEEE 802.15.4 Basics

- 802.15.4 is a simple packet data protocol for lightweight wireless networks
  - Channel Access is via Carrier Sense Multiple Access with collision avoidance and optional time slotting
  - Message acknowledgement and an optional beacon structure
  - Multi-level security
  - Three bands, 27 channels specified
    - 2.4 GHz: 16 channels, 250 kbps
    - 868.3 MHz : 1 channel, 20 kbps
    - 902-928 MHz: 10 channels, 40 kbps
  - Works well for
    - Long battery life, selectable latency for controllers, sensors, remote monitoring and portable electronics
  - Configured for maximum battery life, has the potential to last as long as the shelf life of most batteries

Renato.LoCigno@dit.unitn.it

AdHoc - PAN - Sensors 67

---

---

---

---

---

---

---

---

## IEEE 802.15.4 Device Types

- Three device types
  - Network Coordinator
    - Maintains overall network knowledge; most sophisticated of the three types; most memory and computing power
  - Full Function Device
    - Carries full 802.15.4 functionality and all features
    - Additional memory, computing power make it ideal for a network router function
    - Could also be used in network edge devices (where the network touches the real world)
  - Reduced Function Device
    - Carriers limited (as specified by the standard) functionality to control cost and complexity
    - General usage will be in network edge devices
- All of these devices can be no more complicated than the transceiver, a simple 8-bit MCU and a pair of AAA batteries!

Renato.LoCigno@dit.unitn.it

AdHoc - PAN - Sensors 68

---

---

---

---

---

---

---

---

## ZigBee Topology Models

Renato.LoCigno@dit.unitn.it

AdHoc - PAN - Sensors 69

---

---

---

---

---

---

---

---

## MAC Options

- Two channel access mechanisms
  - Non-beacon network
    - Standard CSMA-CA communications
    - Positive acknowledgement for successfully received packets
  - Beacon-enabled network
    - Superframe structure
      - For dedicated bandwidth and low latency
      - Set up by network coordinator to transmit beacons at predetermined intervals
        - » 15ms to 252sec  
( $15.38\text{ms} \cdot 2^n$  where  $0 \leq n \leq 14$ )
        - » 16 equal-width time slots between beacons
        - » Channel access in each time slot is contention free

---

---

---

---

---

---

---

---

---

---

## Non-Beacon vs Beacon Modes

- Non-Beacon Mode
  - A simple, traditional multiple access system used in simple peer and near-peer networks
  - Think of it like a two-way radio network, where each client is autonomous and can initiate a conversation at will, but could interfere with others unintentionally
  - However, the recipient may not hear the call or the channel might already be in use
- Beacon Mode
  - A very powerful mechanism for controlling power consumption in extended networks like cluster tree or mesh
  - Allows all clients in a local piece of the network the ability to know when to communicate with each other
  - Here, the two-way radio network has a central dispatcher who manages the channel and arranges the calls
- As you'll see, the primary value will be in system power consumption

---

---

---

---

---

---

---

---

---

---

## Example of Non-Beacon Network

- Commercial or home security
  - Client units (intrusion sensors, motion detectors, glass break detectors, standing water sensors, loud sound detectors, etc)
    - Sleep 99.999% of the time
    - Wake up on a regular yet random basis to announce their continued presence in the network ("12 o'clock and all's well")
    - When an event occurs, the sensor wakes up instantly and transmits the alert ("Somebody's on the front porch")
  - The ZigBee Coordinator, mains powered, has its receiver on all the time and so can wait to hear from each of these station.

---

---

---

---

---

---

---

---

---

---

## Example of Beacon Network

- Now make the ZigBee Coordinator battery-operated also
  - All units in system are now battery-operated
  - Client registration to the network
    - Client unit when first powered up listens for the ZigBee Coordinator's network beacon (interval between 0.015 and 252 seconds)
    - Register with the coordinator and look for any messages directed to it
    - Return to sleep, awaking on a schedule specified by the ZigBee Coordinator
    - Once client communications are completed, ZigBee coordinator also returns to sleep

---

---

---

---

---

---

---

---

## ZigBee and Bluetooth

Competitive or Complementary?

---

---

---

---

---

---

---

---

## ZigBee and Bluetooth

### Optimized for different applications

- |   |   |
|---|---|
| <ul style="list-style-type: none"><li>• ZigBee<ul style="list-style-type: none"><li>- Smaller packets over large network</li><li>- Mostly Static networks with many, infrequently used devices</li><li>- Home automation, toys, remote controls, etc.</li></ul></li></ul> | <ul style="list-style-type: none"><li>• Bluetooth<ul style="list-style-type: none"><li>- Larger packets over small network</li><li>- Ad-hoc networks</li><li>- File transfer</li><li>- Screen graphics, pictures, hands-free audio, Mobile phones, headsets, PDAs, etc.</li></ul></li></ul> |
|---|---|

---

---

---

---

---

---

---

---

## ZigBee and Bluetooth

### Address Different Needs

- Bluetooth is a cable replacement for items like Phones, Laptop Computers, Headsets
- Bluetooth expects regular charging
  - Target is to use <10% of host power

---

---

---

---

---

---

---

---

---

---

## ZigBee and Bluetooth

### Address Different Needs

- ZigBee is better for devices where the battery is 'rarely' replaced
  - Targets are :
    - Tiny fraction of host power
    - New opportunities where wireless not yet used

---

---

---

---

---

---

---

---

---

---

### Protocol Stack Comparison

---

---

---

---

---

---

---

---

---

---

## An Application Example

### Battery Life & Latency in a Light Switch

- **Wireless Light switch**
  - Easy for Builders to Install
- **A Bluetooth Implementation would:**
  - use the inquiry procedure to find the light each time the switch was operated.

---

---

---

---

---

---

---

---

## Light switch using Bluetooth

- **Inquiry procedure to locate light each time switch is operated**
  - Bluetooth 1.1 = up to 10 seconds typical
  - Bluetooth 1.2 = several seconds even if optimized
- **Unacceptable latency**

---

---

---

---

---

---

---

---

## Light switch using ZigBee

- **With DSSS interface, only need to perform CSMA before transmitting**
  - Only 200  $\mu$ s of latency
  - Highly efficient use of battery power

**ZigBee offers longer battery life and lower latency than a Bluetooth equivalent**

---

---

---

---

---

---

---

---

## Wireless Keyboard

- Battery-operated keyboard
  - Part of a device group including a mouse or trackball, sketchpad, other human input devices
  - Each device has a unique ID
  - Device set includes a USB to wireless interface dongle
    - Dongle powered continuously from computer
  - Keyboard does not have ON/OFF switch
  - Power modes
    - Keyboard normally in lowest power mode
    - Upon first keystroke, wakes up and stays in a "more aware" state until 5 seconds of inactivity have passed, then transitions back to lowest power mode

---

---

---

---

---

---

---

---

## Keyboard Usage

- Typing Rates
  - 10, 25, 50, 75 and 100 words per minute
- Typing Pattern
  - Theoretical: Type continuously until battery is depleted
    - Measures total number of hours based upon available battery energy

---

---

---

---

---

---

---

---

## Wireless Keyboard Using 802.15.4

- 802.15.4 Operation Parameters
  - Star network
  - Non-beacon mode (CSMA-CA)
  - USB Dongle is a PAN Coordinator Full Functional Device (FFD)
  - Keyboard is a Reduced Function Device (RFD)
  - Power Modes
    - Quiescent Mode used for lowest power state
      - » First keystroke latency is approx 25ms
    - Idle mode used for "more aware" state
      - » Keystroke latency 8-12 ms latency

---

---

---

---

---

---

---

---

## Wireless Keyboard Using 802.15.4

- 802.15.4 Chipset Parameters
  - Motorola 802.15.4 Transceiver and HCS08 MCU
  - Battery operating voltage 2.0 - 3.6 V
    - All required regulation internal to ICs
    - Nearly all available energy usable with end of life voltage at 2.0 volts

---

---

---

---

---

---

---

---

---

---

## Wireless Keyboard Using Bluetooth

- Bluetooth Operation Parameters
  - Piconet network
  - USB Dongle is piconet Master
  - Keyboard is a piconet Slave
  - Power Modes
    - Park mode used for lowest power state
      - » 1.28 second park interval
      - » First keystroke latency is 1.28s
    - Sniff mode used for "more aware" state
      - » 15ms sniff interval
      - » 15ms latency

---

---

---

---

---

---

---

---

---

---

## BT vs. 15.4 Keyboard Comparison

---

---

---

---

---

---

---

---

---

---

### Why BT and ZigBee are so different?

- Bluetooth and 802.15.4 transceiver physical characteristics are very similar
- Protocols are substantially different and designed for different purposes
- 802.15.4 designed for low to very low duty cycle static and dynamic environments with many active nodes
- Bluetooth designed for high QoS, variety of duty cycles, moderate data rates in fairly static simple networks with limited active nodes
- Bluetooth costs and system performance are in line with 3<sup>rd</sup> and 4<sup>th</sup> generation products hitting market while 1<sup>st</sup> generation 15.4 products will be appearing only late this year

---

---

---

---

---

---

---

---
