Multiprocessor Scheduling

❖ Multiprocessor Scheduling

- ❖ The Quest for Optimality
- ❖ Partitioned Scheduling - 1
- ❖ Partitioned Scheduling - 2
- ❖ Global Scheduling
- ❖ Global Scheduling - Problems

● UniProcessor Systems

- ❖ A schedule $\sigma(t)$ is a function mapping time t into an executing task $\sigma : t \rightarrow \mathcal{T} \cup \tau_{idle}$ where \mathcal{T} is the set of tasks running in the system
 - ❖ τ_{idle} is the *idle task*: when it is scheduled, the CPU becomes idle
-
- For a multiprocessor system with M CPUs, $\sigma(t)$ is extended to map t in vectors $\tau \in (\mathcal{T} \cup \tau_{idle})^m$
 - How to implement a Real-Time scheduler for $M > 1$ processors?
 - ❖ Partitioned scheduling
 - ❖ Global scheduling

The Quest for Optimality

❖ Multiprocessor Scheduling

❖ The Quest for Optimality

❖ Partitioned Scheduling - 1

❖ Partitioned Scheduling - 2

❖ Global Scheduling

❖ Global Scheduling - Problems

● UP Scheduling:

- ❖ N periodic tasks with $D_i = T_i$: (C_i, T_i, T_i)
- ❖ Optimal scheduler: if $\sum \frac{C_i}{T_i} \leq 1$, then the task set is schedulable
- ❖ EDF is optimal

● Multiprocessor scheduling:

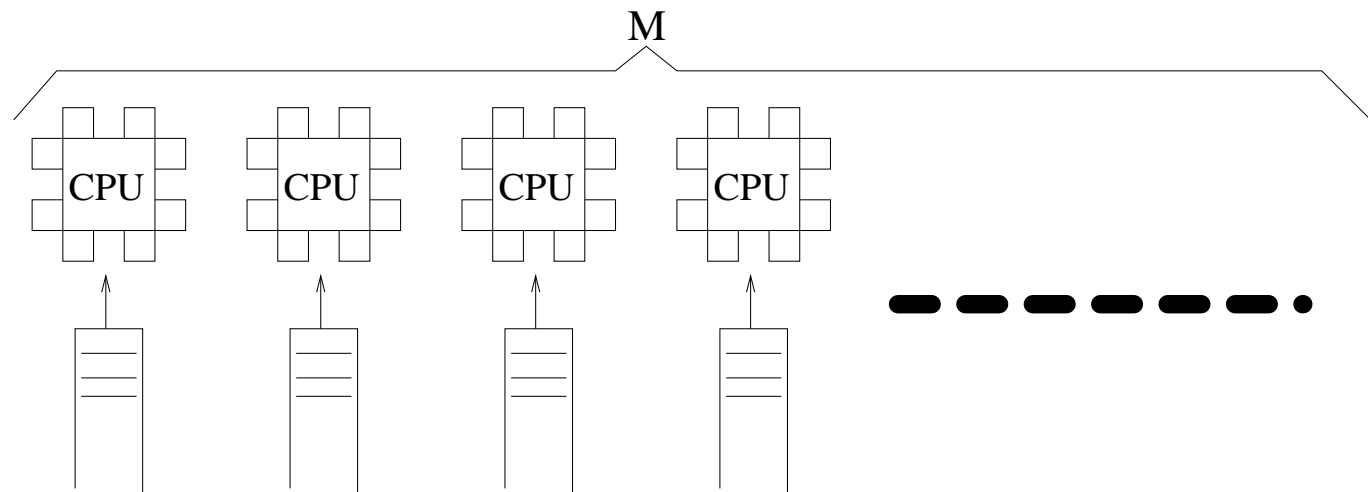

- ❖ Goal: schedule periodic task sets with $\sum \frac{C_i}{T_i} \leq M$
- ❖ Is this possible?
- ❖ Optimal algorithms

Partitioned Scheduling - 1

- ❖ Multiprocessor Scheduling
- ❖ The Quest for Optimality
- ❖ Partitioned Scheduling - 1
- ❖ Partitioned Scheduling - 2
- ❖ Global Scheduling
- ❖ Global Scheduling - Problems

- Reduce $\sigma : t \rightarrow (\mathcal{T} \cup \tau_{idle})^M$ to M uniprocessor schedules $\sigma_p : t \rightarrow \mathcal{T} \cup \tau_{idle}, 0 \leq p < M$

- ❖ Statically assign tasks to CPUs
- ❖ Reduce the problem of scheduling on M CPUs to M instances of uniprocessor scheduling
- ❖ Problem: system underutilisation

Partitioned Scheduling - 2

❖ Multiprocessor Scheduling

❖ The Quest for Optimality

❖ Partitioned Scheduling - 1

❖ Partitioned Scheduling - 2

❖ Global Scheduling

❖ Global Scheduling - Problems

- Reduce an M CPUs scheduling problem to M single CPU scheduling problems and a bin-packing problem
- CPU schedulers: uni-processor, EDF can be used
- Bin-packing: assign tasks to CPUs so that every CPU has load ≤ 1

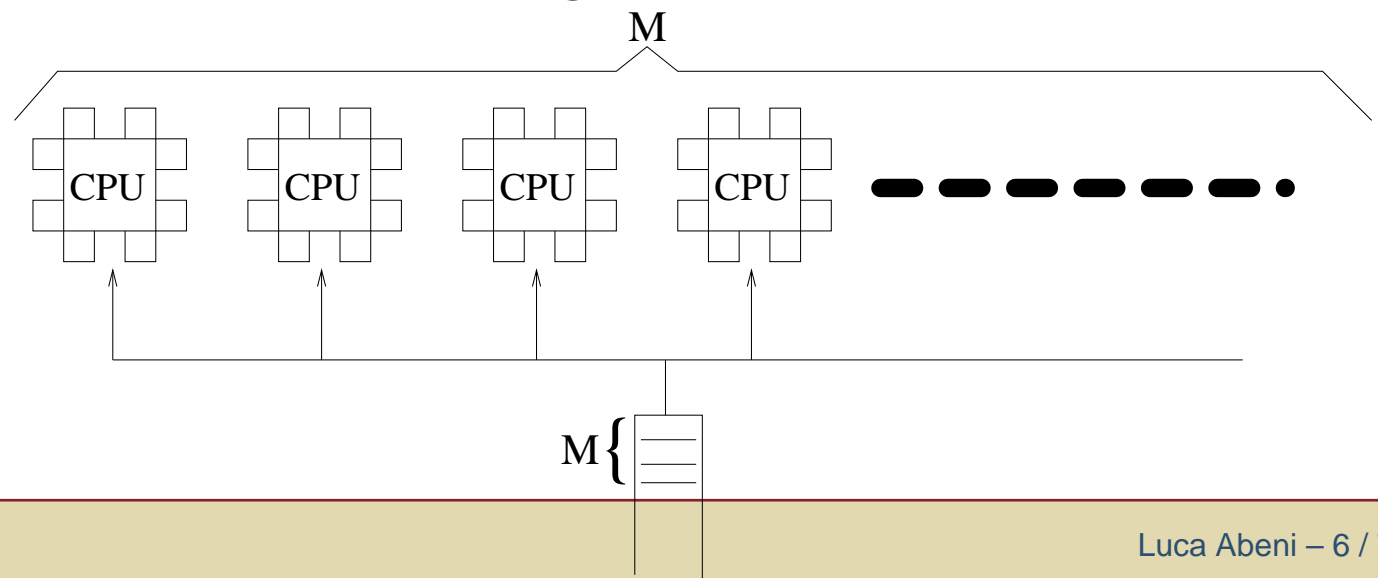

❖ Is this possible?

- Think about 2 CPUs with $\{(6, 10, 10), (6, 10, 10), (6, 10, 10)\}$

Global Scheduling

- ❖ Multiprocessor Scheduling
- ❖ The Quest for Optimality
- ❖ Partitioned Scheduling - 1
- ❖ Partitioned Scheduling - 2
- ❖ **Global Scheduling**
- ❖ Global Scheduling - Problems

- One single task queue, shared by M CPUs
 - ❖ The first M ready tasks from the queue are selected
 - ❖ What happens using fixed priorities (or EDF)?
 - ❖ Tasks are not bound to specific CPUs
 - ❖ Tasks can often migrate between different CPUs
- Problem: schedulers designed for UP do not work well

Global Scheduling - Problems

- ❖ Multiprocessor Scheduling
- ❖ The Quest for Optimality
- ❖ Partitioned Scheduling - 1
- ❖ Partitioned Scheduling - 2
- ❖ Global Scheduling
- ❖ Global Scheduling - Problems

- Dhall's effect: U^{lub} for global multiprocessor scheduling can be quite low (for RM, converges to 1)
 - ❖ Pathological case: M CPUs, $M + 1$ tasks. M tasks $(\epsilon, T - 1, T - 1)$, a task (T, T, T) .
 - ❖ $U = M \frac{\epsilon}{T-1} + 1$. $\epsilon \rightarrow 0 \Rightarrow U \rightarrow 1$
- Global scheduling can cause a lot of useless migrations
 - ❖ Migrations are overhead!
 - ❖ Decrease in the throughput
 - ❖ Migrations are not accounted in admission tests...
